Microscopical anatomy of porcine digestive system

The seminar will be held, to develop skills in microscopical examination of cells and tissue sections. Microscopical slides of the porcine digestive system and the combined organs (see course 08 8a -S-, Macroscopical anatomy of porcine digestive system) with special emphasis of the lymphatic system are included in the lab. By means of routinely stained histological slices and immunohistochemical techniques, the students will be guided to study the structures of the organs.
