Summary of Wave 1 from the household cohort study for SARS-Cov-2 seroprevalence (KoCo19) in Munich

We shall be describing the test strategies through a cross comparison of various diagnostic tests at the disposal to have the methodological basis for the seroprevalence study. Using this method, we apply the test to the random sample of households from Munich to obtain the seroprevalence observed in the general population over 14 years age. Risk factor analyses and the epidemiological outcomes will be described.
